# AI Work for Good

Imagine that Artificial Agents are our co-habitants and making our life simpler, safer, and more productive. A friendly AI agent that learns from you, understand what you look for and works like a partner to solve your problems.

The vision of PEER is to revolutionise current AI systems' design process. Prioritizing user preferences in AI enabled decision-making scenarios. That's the future PEER is working towards. We're developing AI solutions designed to benefit both individuals and industries.

## For example:

### Grocery Shopping with PEER:

In our PEER project, we're making a **special helper for stores**. It's like an app that finds products in the store and gives you the best route to get them. Plus, **it suggests things you might like while you're shopping**, making it a better experience.

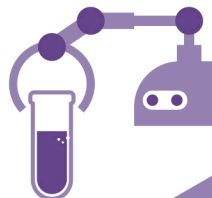

### Inclusive City Navigation with PEER:

PEER can help people with disabilities find the **easiest paths in the city, avoiding tricky spots** like stairs. It's like having a helpful friend warning you about obstacles ahead and suggesting alternative routes. You can even **ask questions without typing**, making it super handy. PEER also learns about you over time, recommending places that are easy to reach and have what you need. An AI assistant like PEER can **look at data from sensors around the city, an figuring out where things need to be fixed to make life easier for everyone**.

### Quality Processes in Industry with PEER:

The "inspection machines" sometimes use old-style image processing to check if products are okay or not. This process can be time-consuming and tricky. But with PEER, we're developing a **smart helper** using AI. **It can predict problems before they happen and guides people on how to fix them earlier on**.

But how to ensure that our AI agent will be our co-worker and not just do what he thinks is true?

● PEER uses **teamwork between different subjects to make decisions using AI**. It mixes ideas from social sciences and AI. It focuses on talking both ways to make people trust and get involved more.

● And it's making an **"AI acceptance index"** to check how well systems work from a human point of view, making sure they fit what people want and expect.

## PEER "in pills"

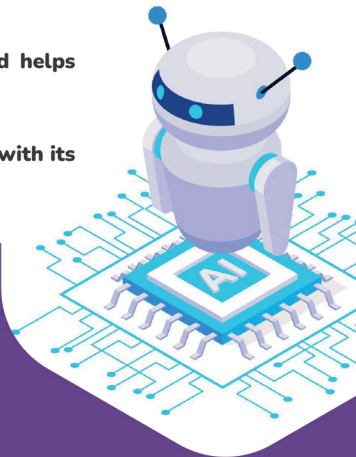

**PROBLEM SOLVER:** It helps you solve problems faster

**SMART CHOICES:** it gives you clear options, so you can make informed decisions.

**IMPROVED USER EXPERIENCE:** as easy as chatting with a friend!

**ECO-FRIENDLY:** it cares about the planet and helps reduce waste

**WORKS WITH YOU:** Provide solutions aligned with its users' preferences

# Artificial intelligence works WITH YOU, not for you.
